# 32.6. `keyword` — Testing for Python keywords

**Source code:** Lib/keyword.py

This module allows a Python program to determine if a string is a keyword.

`keyword.`**`iskeyword`**`(s)`

Return true if *s* is a Python keyword.

`keyword.`**`kwlist`**

Sequence containing all the keywords defined for the interpreter. If any keywords are defined to only be active when particular `__future__` statements are in effect, these will be included as well.
